Managing and mitigating carbon emissions

We work with clients to develop and manage their carbon and climate change strategies, focusing on emissions and carbon financing. Our services help companies to reduce the effects of their activities on the climate.

We provide advice on cleaner and renewable sources of energy generation, emission strategies and trading, urban sustainable master planning and building design.

Thanks to our global skills base and understanding of the local and international context in which businesses operate, we can provide clients with innovative solutions for carbon emissions management and mitigation.

Broad project experience worldwide

With experience in Annex I and non-Annex I countries, we support both owners of and participants in clean development mechanisms (CDM) and joint implementation (JI) initiatives.

In addition to preparing and submitting all CDM documentation, we advise on appropriate methods, rules and requirements of host countries. We have international experience in delivering JI projects and emissions trading.

Our projects include renewable energy installations, green or low-energy building design, greenhouse gas destruction in industrial plants and power generation projects switching to a cleaner-burning fuel mix.

For more information, visit [WSP Environment & Energy website](#) or [contact us](#) to talk to our directors.
